Unit “ 4 : Session “ 12 : SLO “ 2 | Evaluate and Document the Paradigm Usage

■ I. Description (2“3 lines)

- In my project (a task-tracker web app), the entire data-transformation layer is written in the functional paradigm: every update is a pure function that maps the current task list to a new one instead of mutating shared state.
- Filtering completed tasks, sorting by deadline and computing statistics are composed using `map()`, `filter()` and `reduce()` with lambda expressions, so each operation is independently testable.
- Because the functions are side-effect free, the UI simply re-renders from the returned state “ demonstrating referential transparency and making the code easier to debug and extend.
